Qisda

Commitment to No-Deforestation and Biodiversity

Commitment to No-Deforestation and Biodiversity
In accordance with the United Nations Sustainable Development Goal of
protecting forest ecosystems and halting the loss of biodiversity, the
Company continues to stabilize the impact of its value chain on
biodiversity and compensate for this through reforestation efforts,
compliance with national and international laws, and regular inspection
and monitoring. Collaborating with its customers, suppliers and partners
to contribute to the protection of forest ecosystems and biodiversity, Qisda
commits to:

Minimize negative impacts on biodiversity by 2030.

Achieve No Net Loss and Net Positive Impact goals regarding nodeforestation and biodiversity by 2050.

Our strategy for no-deforestation and biodiversity is outlined below:

- New investments and projects must undergo impact and risk assessments regarding forest ecosystems and biodiversity. These operations must promise not to destroy forest ecosystems and biodiversity, and must regularly monitor the protection of forest ecosystems and biodiversity.
- 2. We will continue working hard to achieve the NNL goal by avoiding or limiting procurement from key biodiversity areas or forest areas.
- 3. The Group and its value chain must avoid conducting business operations in national or international protected or conserved areas.
- 4. Collaborate with stakeholders for biodiversity-related projects.
- Avoid negatively impacting biodiversity or destroying forest ecosystems during activities, production or services. If this cannot be avoided, actions must be taken to minimize, compensate and mitigate any impacts caused.
- 6. Provide employees with ecology training sessions to ensure more thorough understanding of the necessity for forest ecosystems and biodiversity.

- 7. Satisfy customer demands for environmentally-friendly, recyclable and renewable paper and packaging materials, thus reducing impact on forest ecosystems and diversity from the perspective of the product life cycle.
- 8. To reduce the impact of operations on forest ecosystems, internal operations use environmentally-friendly office supplies, and encourage energy saving, carbon reduction, waste reduction and recycling.
- 9. Continue to promote reforestation and greening projects, as well as assist biodiversity conservation efforts, maintaining the ecosystems found in the operational site, surrounding community, and society as a whole.
- 10. Conduct biodiversity risk assessments to identify the source of natural impacts.

Short term goals for 2025:

- Select appropriate methods and tools to assess biodiversity risks at all operating sites.
- Communicate the importance of forest conservation and biodiversity to the Group, its suppliers and its customers. Additionally, the Company will encourage suppliers to conduct biodiversity risk assessments at their operating locations to lessen their impact on biodiversity.
